

HOMEMADE DISINFECTING SOLUTION

HOW TO MAKE A 0.02% SODIUM HYPOCHLORIDE DISINFECTING SOLUTION

Suggested areas of use:

doorknobs, window latches, light switches, tables, chairs, elevator buttons, faucets

NOTES:

- ① Sodium hypochlorite is found in chlorine bleach. Household cleaning supplies such as “haita” and bleach contain roughly 5-6%, but please check labels to be sure of the specific concentration.
- ② Sodium hypochloride can cause discoloration of cloth materials
- ③ When disinfecting, please wet a cloth or paper towel with the solution and wipe down surfaces. Spraying the solution directly on the surface may further spread germs.
- ④ Sodium hypochloride may cause corrosion of metal and leaves behind a strong odor. Wipe down surfaces with water 10 minutes after disinfecting.
- ⑤ Sodium hypochloride solutions may not be used for disinfecting hands.
- ⑥ Sodium hypochloride solutions are only effective for 24 hours once mixed. The solution cannot be stored for long periods of time. Please remake the solution for each use.
- ⑦ Chlorine gas may result from use. Please be sure you have proper ventilation.
- ⑧ You must mark containers clearly to avoid accidental ingestion.
- ⑨ If a member of your household has been diagnosed with COVID-19, increase the concentration of sodium hypochloride to 0.05% (1 cap full per 500ml)

Due to the higher concentration of sodium hypochloride in this solution, use gloves when disinfecting and don't forget to wipe down with water after disinfecting.
